- 4. Sample Observations 2

1. Introduction

The QueueBoard demo is an imaginary queue for fictional workshop requests. No actual users or software execution are represented.

1.1 System Overview

QueueBoard assigns illustrative slots to an imaginary workshop attendee and permits an imaginary coordinator to close a slot.

1.2 Test Approach

PLACEHOLDER: The fictional test approach has not been written in this controlled variant.

2. Test Plan

The test scope covers the imagined request and close flows only. No production service or real user is under test.

2.1 Included Features

QB-F01 allocates a sample slot for a nonempty label. QB-F02 rejects blank input. QB-F03 rejects closure without coordinator privileges.

2.2 Optional Illustration (Optional)

Optional only: a small decorative diagram may be added but is not necessary to describe queue checks.

3. Test Cases

The fictional cases below compare predetermined expected outputs with clearly invented scripted examples.

3.1 Inputs

Case QB-T01: DEMO-A with zero open slots. Case QB-T02: blank label. All values are invented.

3.2 Expected Outputs

Before any hypothetical run: QB-T01 expects OPEN S-001; QB-T02 expects REJECT_EMPTY without creating a slot.

3.3 Procedure

In a hypothetical isolated queue, enter the sample input and compare the scripted response with the expected output.

4. Sample Observations

SCRIPTED EXAMPLE ONLY: QB-T01 actual OPEN S-001; QB-T02 actual REJECT_EMPTY. No real software was exercised.
